

Resume Evidence Review

Candidate: Candidate B

Review date: 2026-09-02

Inputs reviewed: Resume, Portfolio, Repository history, Employer product page

Important mismatch - human review needed

Summary

One claim matches the available evidence. One needs an explanation. One important detail does not match the repository history.

Results at a glance

The report reviewed **3 claims**. Each result below has a different meaning. A missing document is not the same as a mismatch.

Plain result	Share	What this means and what to do
Matches the evidence	34% 1 of 3	Reliable information matches the important parts of the claim. No follow-up is needed unless new information appears.
Not enough evidence	0% 0 of 3	Nothing important conflicts, but there is not enough independent proof. Ask for a document, link, or work example if confirmation matters.
Needs an explanation	33% 1 of 3	Part of the claim is unclear, such as the dates, personal contribution, ownership, or result. Ask the listed follow-up question.
Important details don't match	33% 1 of 3	Reliable information disagrees with an important part of the claim. A person should review the evidence and ask the candidate about it.
Unable to check	0% 0 of 3	A meaningful check was not possible because the information is private, confidential, unavailable, or cannot be linked reliably to the candidate.

Important: "Not enough evidence" does not mean the claim is false. It means the review did not find enough reliable information to confirm it. Only "Important details don't match" means reliable information directly disagrees with a claim. These percentages are not a fake-resume score.

Claim-by-claim review

ID	Claim	Result	How sure?	Why
C1	Used React and Node.js on the inventory application.	Matches the evidence	Strong	The technology used in the linked project matches the claim.
C2	The migration reduced processing time by 70 percent.	Needs an explanation	Moderate	The improvement may be real, but the available information does not show how the 70 percent figure was measured or how much of the result came from the candidate's work.
C3	Created the linked inventory application.	Important details don't match	Strong	The history shows later contributions from the candidate, but it does not support the claim that the candidate created the project alone.

Why each claim received this result

C1 - Technology

Claim: Used React and Node.js on the inventory application.

Result: Matches the evidence (Strong confidence in this result)

What we found

- The linked repository contains React client code and a Node.js service.
- Repository dependency manifests: React and Node.js dependencies are present. (<https://example.com/repository>)

What this suggests: The technology used in the linked project matches the claim.

What to do next: Ask normal technical questions if this experience matters for the job.

C2 - Claimed result

Claim: The migration reduced processing time by 70 percent.

Result: Needs an explanation (Moderate confidence in this result)

What we found

- The product launch is documented, but the starting point and calculation for the 70 percent figure were not provided.
- Employer product page: A migration occurred during the stated period. (<https://example.com/product-release>)

What this suggests: The improvement may be real, but the available information does not show how the 70 percent figure was measured or how much of the result came from the candidate's work.

What to do next: Ask how the number was calculated and what work the candidate personally did.

Other possible explanations

- The metric may come from an internal dashboard that is not public.

Follow-up questions

1. What did you compare, what time period did you measure, and where did the numbers come from?
-

C3 - Project ownership

Claim: Created the linked inventory application.

Result: Important details don't match (Strong confidence in this result)

What we found

- The repository existed before the claimed work began, and a different account created the first version.
- Repository commit history: A different account created the repository and its first version. (<https://example.com/repository/commits>)

What this suggests: The history shows later contributions from the candidate, but it does not support the claim that the candidate created the project alone.

What to do next: Have the candidate walk through a representative contribution and explain the repository history.

Other possible explanations

- The project may have been moved from a private repository or created under another account that belongs to the candidate.

Follow-up questions

1. Which parts did you personally create, and was earlier work moved from another repository?
-

What this report cannot tell you

- The review did not include private employer records or reference checks.
- Finding nothing online does not mean the claim is false.
- Private or confidential work may be impossible to confirm from public sources.
- A matching name or profile may belong to someone else.
- This report does not prove that anyone lied or committed fraud. A person must make every hiring decision.
