

Resume Claim Verification Report

Candidate: Candidate B

Review date: 2026-09-02

Inputs reviewed: Resume, Portfolio, Repository history, Employer product page

Human review recommended

Executive summary

The evidence supports one technical claim, leaves one impact claim unresolved, and materially conflicts with the stated sole authorship of a linked project.

Supported	Plausible but unverified	Needs clarification	Material inconsistency	Not assessable
1 claim(s) 34%	0 claim(s) 0%	1 claim(s) 33%	1 claim(s) 33%	0 claim(s) 0%

Percentages describe the distribution of claim assessments, not the probability that a resume is deceptive.

Claim assessment

ID	Claim	Assessment	Confidence	Rationale
C1	Used React and Node.js on the inventory application.	Supported	High	The technical stack in the artifact agrees with the claim.
C2	The migration reduced processing time by 70 percent.	Needs clarification	Medium	The improvement may be genuine, but its magnitude and attribution are not independently supported.
C3	Created the linked inventory application.	Material inconsistency	High	The available history supports later contribution but conflicts with sole creation of the linked repository.

Detailed findings

C1 - Technology

Claim: Used React and Node.js on the inventory application.

Assessment: Supported (High confidence)

Observed evidence

- The linked repository contains React client code and a Node.js service.
- Repository dependency manifests: React and Node.js dependencies are present. (<https://example.com/repository>)

Inference: The technical stack in the artifact agrees with the claim.

Recommended next step: Use ordinary technical interviewing if this experience is job-relevant.

C2 - Quantified impact

Claim: The migration reduced processing time by 70 percent.

Assessment: Needs clarification (Medium confidence)

Observed evidence

- The product launch is documented, but no baseline or measurement method is supplied.
- Employer product page: A migration occurred during the stated period. (<https://example.com/product-release>)

Inference: The improvement may be genuine, but its magnitude and attribution are not independently supported.

Recommended next step: Ask for the measurement method and the candidate's specific contribution.

Alternative explanations

- The metric may come from an internal dashboard that is not public.

Follow-up questions

1. What was the baseline, measurement window, and data source for the 70 percent figure?
-

C3 - Project authorship

Claim: Created the linked inventory application.

Assessment: Material inconsistency (High confidence)

Observed evidence

- The repository predates the stated work and another account authored the original implementation.
- Repository commit history: Another account created the repository and authored the initial implementation. (<https://example.com/repository/commits>)

Inference: The available history supports later contribution but conflicts with sole creation of the linked repository.

Recommended next step: Have the candidate walk through a representative contribution and explain the repository history.

Alternative explanations

- The project may have been migrated from a private repository or developed under another confirmed account.

Follow-up questions

1. Which components did you personally create, and was earlier work migrated from another repository?
-

Limitations and required human review

- The review did not include private employer records or reference checks.
- Missing public evidence is not evidence of deception.
- Confidential or private work may not be independently verifiable.
- Identity matching between records may be uncertain.
- This report does not establish fraud and must not be used as an autonomous hiring decision.
